Organization

We will:

- 1. Try to avoid copying data; when we rely on data from other people, we will read it directly into memory from the network location or Oracle.
- 2. Sometimes this is unnecessary, so we will copy external data into the "data/external" folder. We will have a separate subfolder for shapefiles.
- 3. Store an intermediate data product in "data/intermediate".
- 4. Store final data products in "data/main."
- 5. Use a vintage "suffix" to denote when we have extracted data.

Read in oracle passwords and set network directory

This is a block of code where we set up the oracle passwords and make R aware of folders on the network.

```
source(here("credentials.R"))
# Set the network_location_desktop and network_location_remote variables somewhere OUTSIDE of this code
#Comment one of these out, depending on whether you are running this code on a server or locally (with
net<-network_location_desktop
net<-network_location_remote

# These are not part of the project path
offshoreWind_directory<-file.path(net, "home5", "dcorvi", "OffshoreWind", "offshoreWind4", "data")
spacepanels_directory<-file.path(net, "home2", "mlee", "dropoff", "wind")
cost_directory<-file.path(net, "work5", "socialsci", "Trip_Costs", "2007-2020")

# Set up paths.
East_Cst_crop_2020_path<- here("data", "external", "shapefiles", "East_Cst_crop_2020_extended")
TMSQ_path<-here("data", "external", "shapefiles", "Ten Minute Squares Cut North and Greater Atlantic")
All_Lease_Areas_Shapefile_path<-here("data", "external", "shapefiles", "All_Lease_Areas_Shapefile")</pre>
```

Introduction

The main idea of the model is that the fishermen/decision-makers choose from a number of alternatives, where the choice occasion is a fishing trip and selects the one that yields the highest expected utility level on any given choice occasion. By observing and modeling how decision-makers change their preferred site option in response to the changes in the levels of the site attributes, it is possible to determine how decision-makers tradeoff between the different fishing ground characteristics.

Long Term Objectives

The project objective is to develop a site-choice model primarily, improve, maintain, and disseminate a standardized fisheries dependent data set and analytical summaries that provide a more precise, accurate, comprehensive, and timely evaluation of area-specific socioeconomic impacts associated with ecosystem fishery management initiatives, offshore energy development, and offshore aquaculture development. The site-choice model and underlying data set will help support fishery and ecosystem management decisions to achieve optimum yield in each fishery and the nation's most significant benefit.

Understanding the effects of wind energy areas that are early in the process may be more impactful from a policy perspective. So, not necessarily the current wind areas, but the next block that may be coming over the next 10-30 years. Also, cumulative effects may be important.

Empirical Setting

Scallop Fishery

We are modeling the location choices of fishing vessels in the Limited Access Days-at-Sea scallop fishery. There are approximately 300-330 of these fishing vessels. They are allocated "Open Area Days-at-Sea" and a quantity of trips and/or pounds into the "Access Areas." They catch approximately 95% of the scallops. The Limited Access DAS fleet can be further subdivided into Full-Time, Part-Time, and Occasional Fleets. Vessels primarily use the New Bedford scallop dredge, but a few use a smaller dredge or a bottom trawl. Over the 13 years in our dataset, there are approximately 40,000 trips taken by this fleet, split roughly evenly into "Open areas" and "Access Areas."

For Fishing Year 2016 and earlier, the fishing year Ran from March 1 to Feb 28/29. For fishing year 2017, the year ran from March 1 to March 31. For 2018 and later, the fishing year runs from April 1 to March 31.

Wind Energy

Here is a short description of the wind energy areas and how they will close (or not close) area to fishing. 18 wind areas currently under dev. But many more are likely.

How close will fishing be able to occur within Wind Lease Areas / Turbines?

The wind energy areas do not match the ten minute squares; we are currently planning on simulating the effects of closing a wind energy area by closing an entire ten minute square that is inside or touching a WEA.

The buried cable route from a WEA to shore is likely to be closed as well. Cable buried at shallow depths and marked with concrete.

Purpose

This code extracts and processes data. Our goal is to construct a dataset that can be used to estimate a location choice model at the trip level for the Limited Access Scallop Fishery, using data from 2007-2019 (calendar years). The main datasource is a frozen DMIS table.

Dependencies

This code depends on:

- 1. Network access to get the APSD_DMIS_2.rda and trip cost data from places on the NEFSC network.
- 2. The ability to connect to NEFSC oracle databases (VTR and the Live DMIS tables at APSD.t_ssb_trip_current@garfo_nefsc)

Data Overview

There are four main data sources (so far). None are perfect.

Source	Name
DMIS_APSD_2	DMIS is a Northeast Regional Office data record matching system. Primary data sources include Allocation Management System (AMS) Database, Vessel Trip Reports (VTRs), Dealer Reports, Vessel Monitoring System (VMS) Catch Reports, Observer Reports, Vessel Permit Database, and the MQRS database, which tracks limited access fishing eligibilities
VTR (Vessel Trip	A vessel trip report (VTR) must be received by NMFS or postmarked within 15 days
Reports)	after the reporting month's end. For vessels that also hold a NE multispecies permit, VTRs must be submitted weekly by Tuesday of the week after the fishing trip ends. Copies of VTRs must be retained on board the vessel for 1 year after the last entry on the log and otherwise retained for 3 years after the date of the last entry on the log. If no fishing activity occurred during a reporting period (week or month), then a VTR must be submitted stating that no fishing trips were taken.
Vessel Monitoring	All vessels issued a Federal scallop permit are required to have an active VMS unit
System (VMS)	and must use their VMS unit to declare all vessel activity, including fishing trips and transiting.
Cost data	Werner et al predict estimate a model of trip costs. Predictions (in and out of sample) are used

We have decided to use the DMIS as our primary dataset. DMIS primarily uses Vessel Trip Reports (VTRs) for "trip" and "effort" data and dealer databases for landings. A drawback of using these data are that there is a single point (latitude and longitude) for each time a vessel deploys a particular type of gear into a statistical area. In the LADAS scallop fleet, vessels rarely, if ever, will switch gears at sea. So, a trip is most likely to have multiple VTRs if it switches statistical areas.

There aren't any big incentives (yet) to misreport statistical areas in Scallop. Unlike groundfish, scallop open areas are all managed with one control (Days-at-Sea). And fishing in the Access Areas, but reporting open areas could occur. But vessels need to declare in, so this is a very risky proposition if you are caught fishing in an Access Area, but declared into an open area.

By choosing to represent the trip as a single point, or as inside a homogeneous ten minute square, we may not have the ability to answer our research question. Alternatively, do we have the ability to model at the sub-trip level?

Other possibilities were considered for our primary dataset:

- 1. Observer cover a subset of the fishery. According to the 2021 SBRM report, it was approximately 8-10% of effort for the Limited access fleet. This would provide haul level lat-lon and estimates of catch for the sampled subset. We viewed the subset as too limited it would provide us with observations of approximately 200 Access area and 100 open area trips per year. Observer data contains the sailing and landing port.
- 2. VMS VMS data would provide lat-lon at a high frequency. Other researchers have used this; however we uncomfortable with figuring out how to allocate catch along the VMS track. VMS data contains the sailing and landing port.
- 3. Rasters. The raster data are an intermediate data product that combines trip report with a statistical model describes the distance between observed hauls and the vtr point location. This allows for a smoothing of effort catch across a non-arbitrary grid (like a 10 minute square, statistical area, or just a lat-lon point).

DMIS

We are using the DMIS APSD 2 table.

Column	Description	
Column	Description	
DOCID	VTR DOCUMENT table record identifier; Primary key, internally generated at	
	scanning based on vessel id and date/time sailed. Each DOCID represents one trip; equivalent to TRIPID in VESLOG tables.	
ъ.	•	
Dates	VTR land date, AMS Land Date, Dealer Sold Date Trip date is broken down into	
	fields Calendar_Year, Month_of_Year, Week_of_Year, and Day_of_Year	
DDLAT	Latitude in decimal degrees	
DDLON	Longitude in decimal degrees	
PERMIT	Six-digit vessel fishing permit number assigned by the NE Regional Office permit	
	system	
DOLLAR	This is the value of fish sold. An imputed price is used in cases where the value was	
	not reported.	
POUNDS	POUNDS is live weight, (in the shell)	
LANDED	LANDED can be meat weights or shell weights, but is usually meats	
TRIP LENGTH	Trip length is in days; It is calculated from the elapsed time between the date-time	
_	sailed and date-time landed. This is a measure of days absent.	

Ports – currently assuming that a trip departs from the same place it lands. An alternate assumption is that people just leave from the place where they made their last landing.

The DDLAT and DDLOn are self reported lat-lons from logbooks(VTRs). We have supplemented this with some extra information.

Column	Description
TRIP_ID	
DOCID	VTR DOCUMENT table record identifier; Primary key, internally generated at scanning based on vessel id and date/time sailed. Each DOCID represents one trip; equivalent to TRIPID in VESLOG tables.
ACTIVITY_CODE PLAN_CAT	Complicated set of letters and numbers. See below LGC_A LGC_B, LGC_C, SC_2, SC_3, SC_4, SC_5, SC_6, SC_7, SC_8, SC_9, SG_1A, SG_1B are a collection of true and false variables the indicate if the vessel had a particular permit when the trip was taken.

ACTIVITY_CODE and a set of PLAN_CAT categorical variables are used from the live DMIS tables. We join using TRIP_ID, DOCID. See here

Description of the VTR data.

Column	Description	
TRIPID	VESLOG Trip record identifier, which is generated internally and used for linking	
tripcatg	(only commercial categories are selected), recreational and RSA/EFP are not.	
operator	Name of the captain	
opernum	Captains Identification number	
permit	Six-digit vessel fishing permit number assigned by the NE Regional Office permit system	
nsubtrip	Number of subtrips (see description of subtrips	
crew	number of crew, including captain	
port	6 digit numeric code for the port, renamed to VTR_PORTNUM to make clear is a companion to VTR_PORT and VTR_STATE	

Description of the SPACEPANELS data.

Column	Description
TRIPID	VESLOG Trip record identifier, which is generated internally and used for linking
geoid	10 digit county subdivision from US Census.
state_fips	2 digit state fips code
portlnd1	string of the name of the port that the vessel operator writes on the VTR.
state1	2 letter abbreviation of the state
port	6 digit port code. Should match vtr_portnum from VTR
namelsad	Name and Legal/Statistical description
port_lat	Latitude of the geoid
port_lon	longitude of the geoid
previous_geoid	Geoid of landing port for previous trip
$previous_state_fips$	2 digit state fips code for previous trip
previous_namelsad	Name and Legal/Statistical description for previous trip
previous_port_lat	Latitude of the geoid for previous trip
$previous_port_lon$	longitude of the geoid for previous trip

The spacepanels data tidies up vtr ports and aggregates them to the US Census county subdivision. You should *not* expect an exact match between portlnd1, state1, and port in the spacepanels dataset compared to the same columns in the raw vtr because some data clean was done on these fields. The code is in the spacepanels repo, "just_ports.do."

- Geoid is geoid10. The lat-lons are either the centroid of the geoid and/or adjusted to the coast. There is probably some error here, but if the goal is to use these points to help construct distances or costs to go fishing, they are probably accurate enough.
- namelsad is a convenient name (Like "Boston city"). However, be aware that there are some places with the same name, so use either the geoid or the namelsad plus state or state_fips. This could also be solved by using the namelsad as factor levels This dataset includes all trips from 1996-2021. Use the vintage date appended to the end of the file to assess whether the final year of data is "complete" enough for your purposes. The following corresponds to all trips, not just scallop trips:

- Missing tripids. there are missing tripids prior to 2003. These correspond to SCOQ.
- Missing vtr_portnum There are about 183 obs. These are 2019-2021 and probably reflect changes in the underlying data that haven't been picked up and cleaned in the code. I am not going to deal with these.
- Missing geoid. There are about 3,000 obs. Many of these are because the vtr_port is "Other State". A few are missing because of a new port.
- There is a set of previous_ variables. These were constructed using this code:

```
bysort permit (datelnd1 tripid): gen previous_geoid=geoid[_n-1]
bysort permit (datelnd1 tripid): gen previous_namelsad=namelsad[_n-1]
bysort permit (datelnd1 tripid): gen previous_state_fips=state_fips[_n-1]
```

- It's possible that the previous trip was the same day. It's also possible that the previous trip was from years before.
 - *The date that I am using here is the dateInd1 field from VESLOG_T, if those are somehow missing, I have used datesold from VESLOG_S. I am using something from the Clam logbooks, but I'm not positive as to what. I normally used the datesold in VESLOG_S for spacepanels.
- More of the previous_ variables are missing. This is expected, because the first observation of a permit will be missing something. I don't think this will cause too much of a problem. Some will be missing if the prior trip was a "other state."

Description of the VMS data.

We are currently not using the VMS data directly.

Description of the Cost data.

Column	Description
Place	holder
Place	holder

Load Offshore Wind Tool Data sets

The frozen DMIS table from the offshoreWind project (APSD_DMIS_2) is the base dataset for the analysis. The DMIS data are formed by combining many datasets, including VTR and Dealer. In brief, the APSD_DMIS_2 dataset contains a mix of trip attributes (port, date), sub-trip attributes (gear, location), and catch outcomes (species, pounds, landed, dollar). You can read more about DMIS here.

```
load(file.path(offshoreWind_directory, "APSD_DMIS_2.rda"))
#load("~/offshoreWind-master/data-raw/REVENUEFILE.Rdata")
#load("~/offshoreWind-master/data/APSD_DMIS_2.Rdata")
```

Read in Port lats and lons

Load in the lats and lons of all ports from the spacepanels directory. Change the column names to clarify that the lat-lons are the ports. Join this to the APSD DMIS 2 dataset, keeping all rows of the APSD DMIS 2

dataset and dropping any rows from tripids geoids that do not match.

```
#Import Data
tripid_geoids<- haven::read_dta(file.path(spacepanels_directory,"just_ports_2022_01_26.dta"))
#Could do all this in one step, but ...
# Pick the cols that start with previous
prev<-tripid_geoids[grep1("^previous_", colnames(tripid_geoids))]
#pick the rest of the cols
tripid_geoids<-tripid_geoids[c("tripid","geoid", "namelsad", "state_fips","port_lat","port_lon")]
#cbind the two together
tripid_geoids<-cbind(tripid_geoids,prev)</pre>
APSD_DMIS_2<-merge(APSD_DMIS_2,tripid_geoids, by.x="DOCID", by.y="tripid", all.x=TRUE, all.y=FALSE)
```

This match should be pretty good for source=DMIS. But it will not work for source=SFCLAM.

Loading Data fom Oracle

The APSD_DMIS_2 table must be supplemented with additional data. This section queries the Oracle databases to extract additional information.

VTR Data

Some Trip-level data in the VTR schema is needed. See table at the top. We extract them here.

Scallop LA IFQ Linking variables

We also extract the activity code from DMIS. This will describe the type of trip that the vessel has declared into. The most important types of trips will be Scallop Trips; however, fishing vessels with the proper permits are allowed to retain scallops while declared into other fisheries. When this happens, the volume of scallops will be much lower.

We also extract the T/F variables corresponding the the PLAN CAT in DMIS.

```
oracle_server = "sole"
CURRENT.QUERY = paste ("SELECT TRIP_ID, DOCID, ACTIVITY_CODE, LGC_A, LGC_B, LGC_C, SC_2, SC_3, SC_4, SC
FROM APSD.t ssb trip current@garfo nefsc")
Scallop_Linkingorg = sqlQuery(ODBC.CONNECTION, CURRENT.QUERY)
odbcCloseAll()
We classify the trips as FullTime, PartTime based on these PLAN_CAT variables. We also generate
categorical variables corresponding to LA and GC columns. Note that a vessel can hold both an LA and
a GC permit at the same time. The summary tables below will have lots of observations corresponding to
Scallop_Linkingorg[ftpt]=0, LA=0, and GC=0. This is expected. because it has everything from DMIS.
# Bin the LA vessels into full time or part time.
Scallop_Linkingorg$ftpt<-"None"</pre>
Scallop_Linkingorg$ftpt[Scallop_Linkingorg$SC_2=="TRUE"]<-"FullTime"</pre>
Scallop_Linkingorg$ftpt[Scallop_Linkingorg$SC_5=="TRUE"]<-"FullTime"</pre>
Scallop_Linkingorg$ftpt[Scallop_Linkingorg$SC_7=="TRUE"] <- "FullTime"
Scallop_Linkingorg$ftpt[Scallop_Linkingorg$SC_6=="TRUE"]<-"PartTime"</pre>
Scallop_Linkingorg$ftpt[Scallop_Linkingorg$SC_3=="TRUE"] <-"PartTime"</pre>
# Construct a logical variable for GC
Scallop_Linkingorg$GC<-(Scallop_Linkingorg$LGC_A=="TRUE" | Scallop_Linkingorg$LGC_B=="TRUE" | Scallop_L
# Construct a logical variable for LA
Scallop_Linkingorg$LA<-(Scallop_Linkingorg$ftpt=="PartTime" | Scallop_Linkingorg$ftpt=="FullTime")
#Make some tables
table(Scallop_Linkingorg$ftpt)
##
## FullTime
                 None PartTime
      83353 4372387
                         16849
table(Scallop_Linkingorg$GC)
##
##
     FALSE
              TRUE
## 3929661 541190
table(Scallop_Linkingorg$LA,Scallop_Linkingorg$GC)
##
                       TRUE
##
             FALSE
##
     FALSE 3881029 489620
     TRUE
             48632
                      51570
#Select certain columns
Scallop_Linkingorg_bak<-Scallop_Linkingorg</pre>
Scallop_Linkingorg<-dplyr::select(Scallop_Linkingorg, c(TRIP_ID,DOCID, ACTIVITY_CODE, ftpt, GC,LA))
is.logical(Scallop_Linkingorg$GC)
```

[1] TRUE

```
is.logical(Scallop_Linkingorg$LA)
```

```
## [1] TRUE
```

We don't want to create a single plan column, because a vessel could have multiple kinds of scallop permits. Instead, if we want just the Fulltime LA vessels, we can do something like:

```
Limited_Access <-Scallop_Linkingorg %>%filter(LA=="TRUE")
Limited_Access_ft<-Limited_Access %>%filter(ftpt=="FullTime")
```

Data Cleaning

- 1. Filter down to only Scallop Species
- 2. Seperate Dates & Times and Delete Old Dates Column
- 3. Delete Columns that are not need
- 4. NESPP3 & SOURCE Values do not vary across the observations, so these two columns can be deleted

```
Scallops <- APSD_DMIS_2 %>% filter (SPPNAME == "SCALLOPS/BUSHEL")

#Separate Dates & Times
Scallops$Date <- as.Date(Scallops$DATE_TRIP)
Scallops$Time <- format(Scallops$DATE_TRIP,"%H:%M:%S")

#Drop columns that are not needed
Scallops$DATE_TRIP<- NULL
Scallops$NESPP3<- NULL
Scallops$SOURCE<- NULL
```

Merging

- 1. Merge Scallops & VTR Data Sets (RESULT.COMPILED). We keep all columns from both the APSD_DMIS_2 and RESULT.COMPILED datasets. We also:
 - 1. Filter out 2020 values

VTR_DMIS_merge\$PERMIT.x <- NULL</pre>

- 2. Delete Extra PERMIT Column because there were a few missing values.
- 3. Delete all TRIPCATG that are not 1. This isolates all commercial trips
- 4. Drop rows corresponding to a "Not Fished" VTR.
- 2. Join the output of (1) with Activity Codes
- 3. Verify that we get what we think we should get.

```
##1. Merge Scallops & VTR Data Sets (RESULT.COMPILED). We keep all columns from both the APSD_DMIS_2 an # all.x = TRUE & all.y = FALSE means I am keeping data with no match from DMIS table but dropping data # DOCID is used because of the following found in the data dictionary "VESLOG Trip record identifier, w VTR_DMIS_merge <- merge(RESULT.COMPILED,Scallops, by.x = "TRIPID", by.y = "DOCID", all.x = FALSE, all.y ## Filter out 2020 values VTR_DMIS_merge <- VTR_DMIS_merge <- VTR_DMIS_merge %>% filter(YEAR <= END.YEAR) ## Delete Extra PERMIT Column ## Note: X was deleted because PERMIT.y had zero NAs and PERMIT.x had 25
```

```
## Type of trip: 1=Commercial; 2=Party; 3=Charter; 4=RSA/EFP. Note: RSA/EFP landings represent a small
VTR_DMIS_merge <- VTR_DMIS_merge %>% filter(TRIPCATG == "1")
VTR_DMIS_merge$TRIPCATG <- NULL</pre>
# Delete all NOT_FISHED that are not 0. This indicates whether the 'Did not fish' box was checked on th
VTR DMIS merge <- VTR DMIS merge %>% filter(NOT FISHED == "0")
VTR_DMIS_merge$NOT_FISHED <- NULL</pre>
## 2.
###Join VTR & DMIS Data with Activity Codes
# Delete duplicate rows; These are rows that share the same TRIPID, DOLLAR, LANDED, & TRIP_LENGTH
## Note: VTRs are self-reported and there is a potential for records to be submitted to regional office
VTR_DMIS_AC <- merge(VTR_DMIS_merge,Scallop_Linkingorg, by.x = "TRIPID", by.y = "DOCID", all.x = TRUE,
VTR_DMIS_AC <- VTR_DMIS_AC %>% distinct(TRIPID,DOLLAR,TRIP_LENGTH,LANDED, .keep_all = TRUE)
#Split Activity codes to allow for easier data management. VMS Declaration code book is broken down by
VTR_DMIS_AC$ACTIVITY_CODE <- as.character(VTR_DMIS_AC$ACTIVITY_CODE)</pre>
VTR_DMIS_AC <- VTR_DMIS_AC %>% separate(ACTIVITY_CODE, into = c('Plan Code', 'Program Code', 'Area Identi
## Warning: Expected 4 pieces. Missing pieces filled with 'NA' in 158536 rows [1,
## 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, ...].
VTR DMIS AC$ - - <- NULL
## 3.
### Testing Reported NAs in new data set (that they are relatively even across all years)
#### Note: The variable used in this command can be substituted for whatever needs to be tested. In thi
testing <- VTR_DMIS_AC %>%
group_by("YEAR") %>% filter(is.na(OPERNUM))
```

Delete all TRIPCATG that are not 1. This isolates all commercial trips

Add in cost data

These data should reference the "Estimation of Commercial Fishing Trip Costs Using Sea Sampling Data" paper by Samantha Werner & Geret DePiper. We will likely use the Winsorized trip cost estimates.

```
#Import Data
X2007_2012 <- read_excel(file.path(cost_directory,"2007_2012.xlsx"))
X2013_2020 <- read_excel(file.path(cost_directory,"2013_2020.xlsx"))

#Merge 2007-2012 costs with 2013-2020 costs

Data Aggregating Trip Revenues & Delete duplicate TRIPIDs

Subtrips are generated when a vessel switches gear or statistical areas. Subtrips have identical TRIPID/DOCID. A trip may have many (8+) subtrips, but the majority of trips observed only have one subtrip (95.7% using original VTR & DMIS merged data set). If a trip has just 1 subtrip, the trip took place in a single statistical area. If a trip crosses four different statistical areas, the NSUBTRIP is then equal to 4, and the landings, value, latitude, and longitude are reported separately for each area. For this project based on the proportion of limited access trips that have more than 1 subtrip, the fraction of landings/value, and the trip durations, we are adopting the assumption that trips with 1 subtrip are representative of the entire fishery.

```

```

Since our goal is to estimate a choice model at the trip level, we need to construct trip level variables. We retained the subtrip attributes (GEARCODE, DDLAT, DDLON) corresponding to the subtrip with the highest DOLLAR. We constructed trip-level values for revenue, pounds, and landed (DOLLAR, POUNDS, LANDED). The trip level variables are prefixed with "Agg_".

5910.

... with 2 more variables: Aggregated_LANDED <dbl>, Average_LANDED <dbl>

29100

4157.

- 1. Aggregate DOLLAR, POUNDS, LANDED
- 2. Add back into original data set

7

7

- 3. Check / Test Maximum DOLLAR values by grouping by TRIPID
- 4. Drop duplicate TRIPIDs by keeping maximum DOLLAR values

41369.

This may not be realistic. There are anecdotes of vessels fishing in one spot on the way to another, further offshore spot. Subtrips may be a bigger issue when we extend to other fisheries. If we have the ability to model fishing choices at a finer scale than at a trip, this can be modified fairly easily.

DEPRECATED - Code to aggregate subtrip landings to subtrips.

We are now pulling subtrips along to the end instead of aggregating. If you want to contract multi-area or multi-gear trips down to a single observation, this is how you would do it.

```
### 1. Aggregate DOLLAR, POUNDS, LANDED
Agg_DOL_POUN_LAND <- VTR_DMIS_AC %>%
    group_by(TRIPID) %>%
    summarise(Agg_DOLLAR = sum(DOLLAR), Agg_POUNDS = sum(POUNDS), Agg_LANDED = sum(LANDED))

#### Testing to make sure there are no duplicates in TRIPID groups; this should equal 0
    sum(duplicated(Agg_DOL_POUN_LAND$TRIPID))
    stopifnot(sum(duplicated(Agg_DOL_POUN_LAND$TRIPID))==0)

### 2. Add back into original data set
#### all = FALSE is used to keep only rows that match from the data frames
VTR_DMIS_AC_Agg <- merge(VTR_DMIS_AC,Agg_DOL_POUN_LAND, by.x = "TRIPID", by.y = "TRIPID", all.x = TRUE,</pre>
```

```
### 3.Parse out Maximum Dollar amounts in order to drop lesser subtrips
VTR_DMIS_AC_Agg <- VTR_DMIS_AC_Agg %>% group_by(TRIPID) %>% filter(DOLLAR == max(DOLLAR))
### Another way to check this is by running the following code: VTR_DMIS_AC_Agg %>% group_by(TRIPID) %>
## Test out
sum(duplicated(VTR_DMIS_AC_Agg$TRIPID))
stopifnot(sum(duplicated(VTR_DMIS_AC_Agg$TRIPID))==0)
```

Trips reported on land will be dropped from observations

```

Here is some code that we are no longer using.

Code to filter on the Limited Access (LA) Fleet using landings and crew size

We considered filtering out the LADAS scallop fleet by using landings greater than or equal to 850 pounds and Crew less than or equal to 8. These are based on crew limits. We are using the activities codes instead. In summary:

FY2007-2014: No limit on crew (except for 7 in DMV starting in FY2014) FY2015-2019: 8

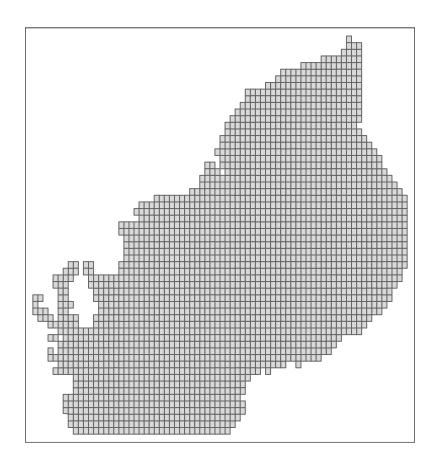

Figure 1: 10 minutes squares

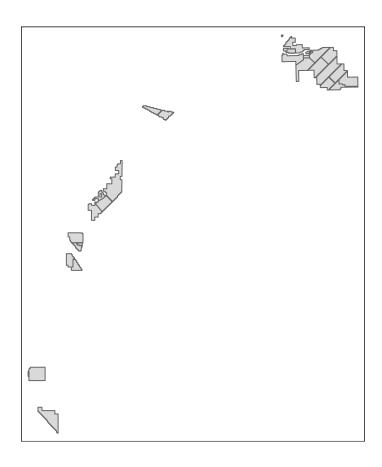

Figure 2: Wind Energy Areas

Initially, vessels had the same crew limits in access areas as they did on DAS. However, Framework 18(fishing year 2006) eliminated the seven-person crew limit (five-person limit for small dredge category vessels) for scallop access area trips. The purpose of this was to eliminate inefficiencies caused by the crew limit for fishing activity that is limited by a possession limit. The crew limit was established to control vessels' shucking capacity when fishing under DAS.

Eight years later, Framework 25 (fishing year 2014) imposed a crew limit of seven individuals (the same as DAS) per limited access vessel (five-person limit for small dredge category vessels) in DMV. The purpose of this was to protect small scallops and discourage vessels from highgrading.

Framework 26 (fishing year 2015) implemented crew limits for all access areas. In an effort to protect small scallops and discourage vessels from high-grading. Framework 26 imposed a crew limit of eight individuals (one extra from DAS) per limited access vessel, including the captain, when fishing in any scallop access area. If a vessel is participating in the small dredge program, it may not have more than six people (one extra from DAS) on board, including the captain, on an access area trip.

Finally, because the scallops in the NLS–S–D were expected to have lower yield than similar sized scallops in other areas, Framework 32 (fishing year 2020) allowed two additional crew members aboard both limited access full-time (10 in total) and limited access full-time small dredge vessels (8 in total). This allowed vessels to add additional crew members to increase the shucking capacity of the vessel and reach the possession limit in a time more consistent with other access areas. (Travis Ford @ GARFO - Nov 17,2021)

FY2007-2014: No limit (except for 7 in DMV starting in FY2014) FY2015-2019: 8

LA_Estimate <- VTR_DMIS_AC_Agg %>% filter(Agg_LANDED >= 850 & CREW <= 8)
